# sentinel-oo: the classes

a crate arrives, a crate leaves.  one component decides, and it is neither the orchestrator nor the model.

*two thin adapters, one orchestrator.  neither holds a rule.*

**api**  **for pipelines and people**

POST /check/{contract}  GET /graph/{run}

GET /contracts  GET /contracts/{name}  GET /health

**mcp**  **for the coordinator agent**

check_handover  list_handovers

read_contract  get_run_graph

## Sentinel

sequences the collaborators it was handed.  holds no rule of its own.

*no subclass.  a handover is a Contract, never a class.*

**Replaceable.  handed in when the service starts.**

*dashed border means abstract*

### *RuleEngine*

the only thing
that decides

ContractChecks

### *Engine*

the model.
advises, never decides

NullEngine (the default)
ScriptedEngine
CommandEngine

**Fixed.  one of each.**

### ContractRegistry

holds contracts.
executes nothing

### Repairer

changes only what
the rules pointed at

### ProvenanceWriter

writes the record.
alters nothing else

### RunStore

the last N runs.
oldest dropped

### BuildIdentity

which image, commit
and contracts ran

**Data that moves between them.**

*value objects:  Requirement  Violation  Change  Verdict*

### Crate

immutable. a change
returns a new one

### Contract

one handover's rules.
a file, not code

### Report

what the rules found,
and the verdict

### Blessing

the record written
into the crate

### Run

one execution,
start to finish

***Outside the service, and what makes an instance yours***

contract files, mounted at /contracts  deploy.py  validates them, builds the image, starts it, then checks it serves what was validated
